If you've ever been so hungry that you became "hangry", you understand the importance of nutrition

Which is why WIC provides nutritional assistance, education, and support and referrals to health care and community services to prenatal moms and their children thru age 5

Because a healthy start is associated with many positive outcomes

School readiness

Better grades

**Socioeconomic
benefits**

**Lifelong health
outcomes**

But we've seen our retention rates dropping since 2011, only 28% of children staying in the program through age 5

% still in program at 1 year of age (retention)

Completion status through age 5

We have some theories –
the many federal rules
can be burdensome and
no one likes using paper
checks

But could digging into our data help confirm our theories and identify more ideas for why retention is falling?

Data**Science**_{SF}

From the start, we knew this would be a quantitative project and a qualitative project to fully understand the trends

Quantitative

Qualitative

So we partnered with the Innovation Office's Civic Bridge program to bring in Google partners for the qualitative analysis

Quantitative

WHY

CIVIC BRIDGE 

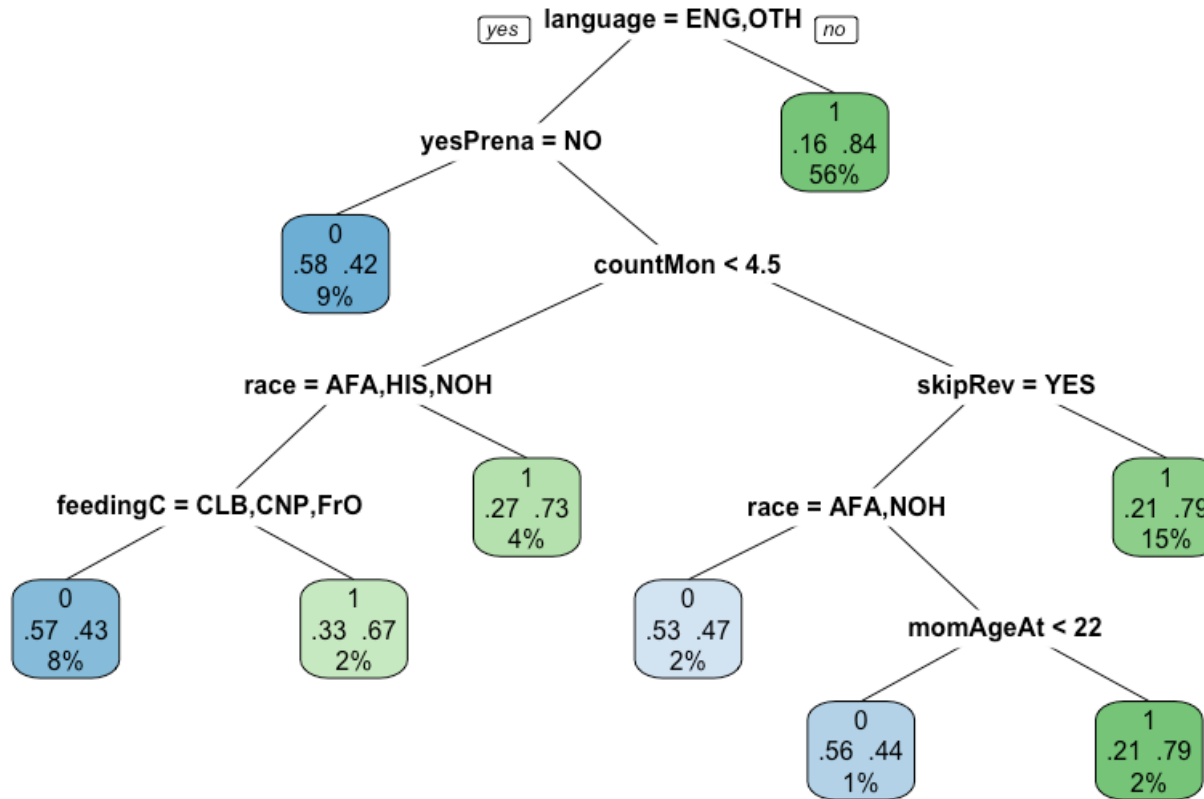

Many things may affect participation and retention

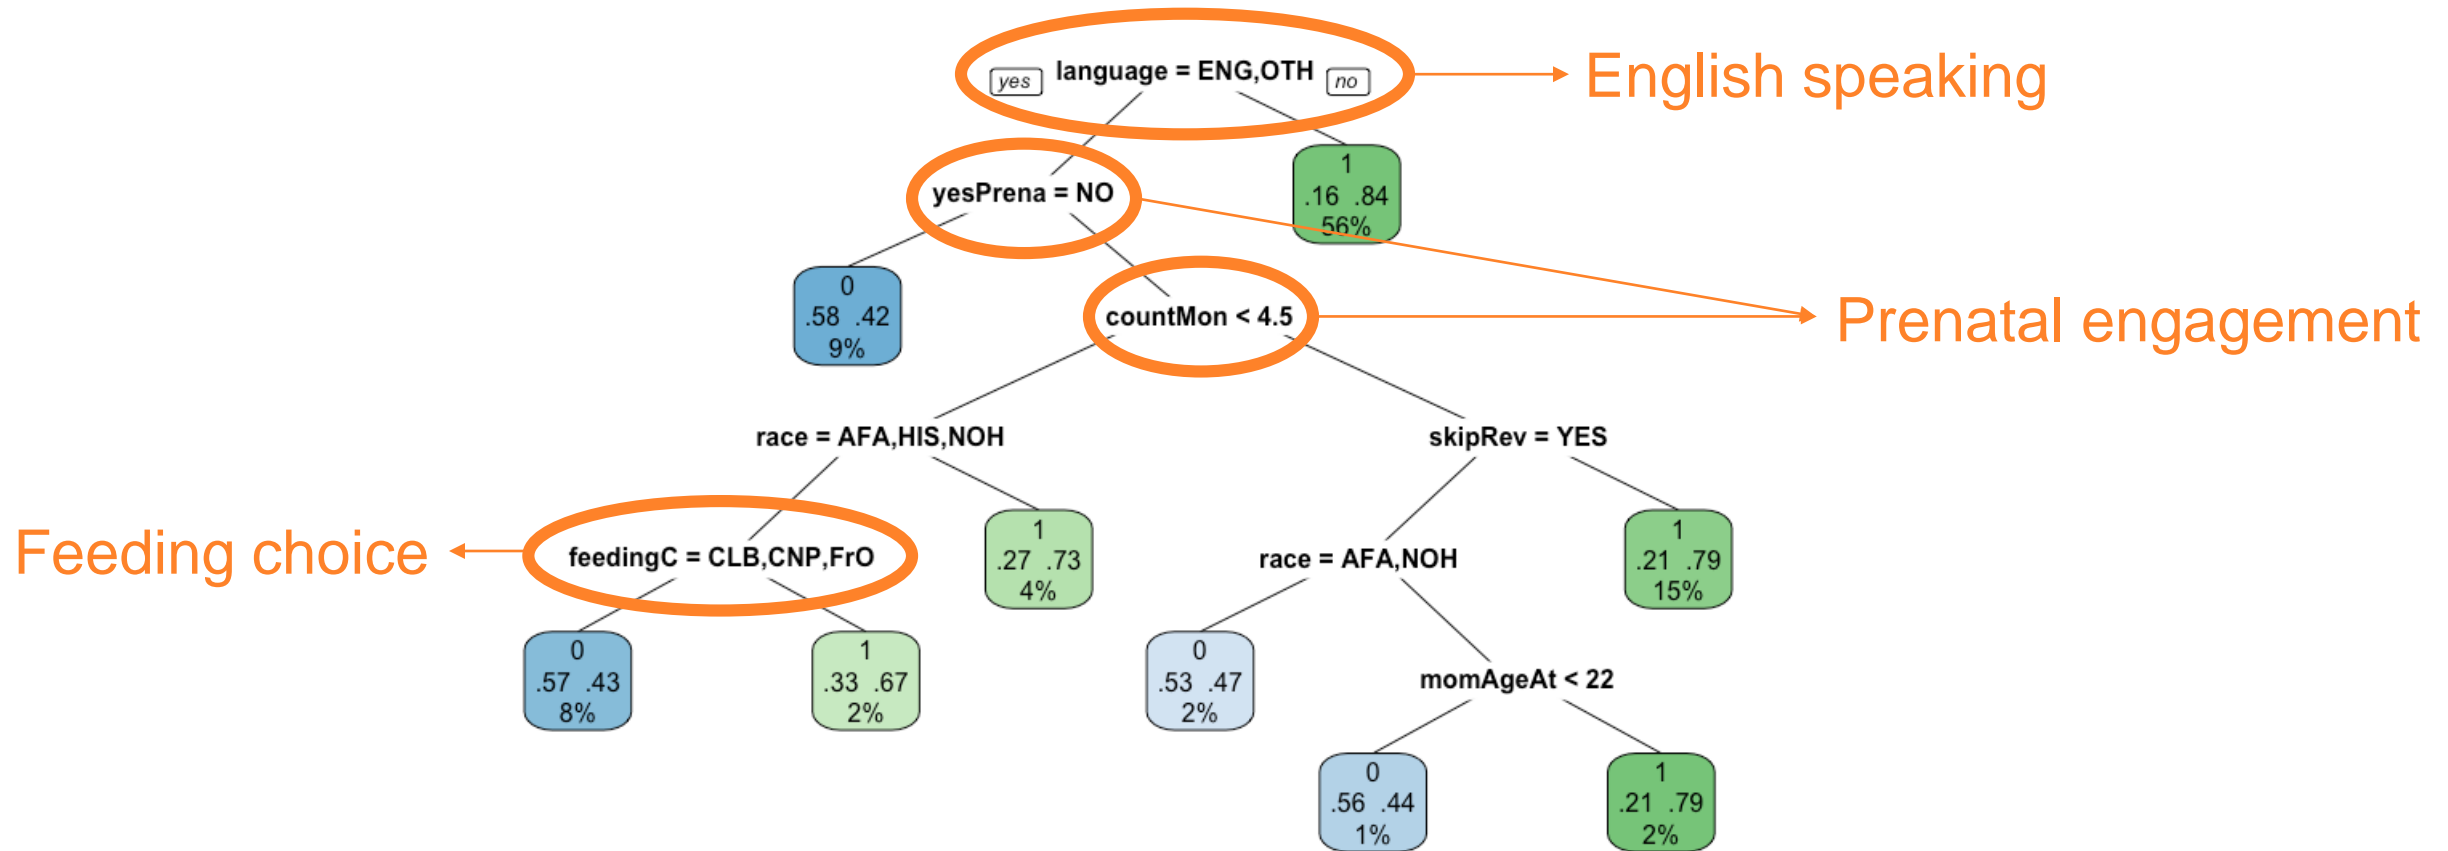

The goal of a predictive model is to look at all of these factors simultaneously to understand what are the strongest indicators of someone dropping out

Our tree model is able to predict with 83% accuracy who is most likely to drop out

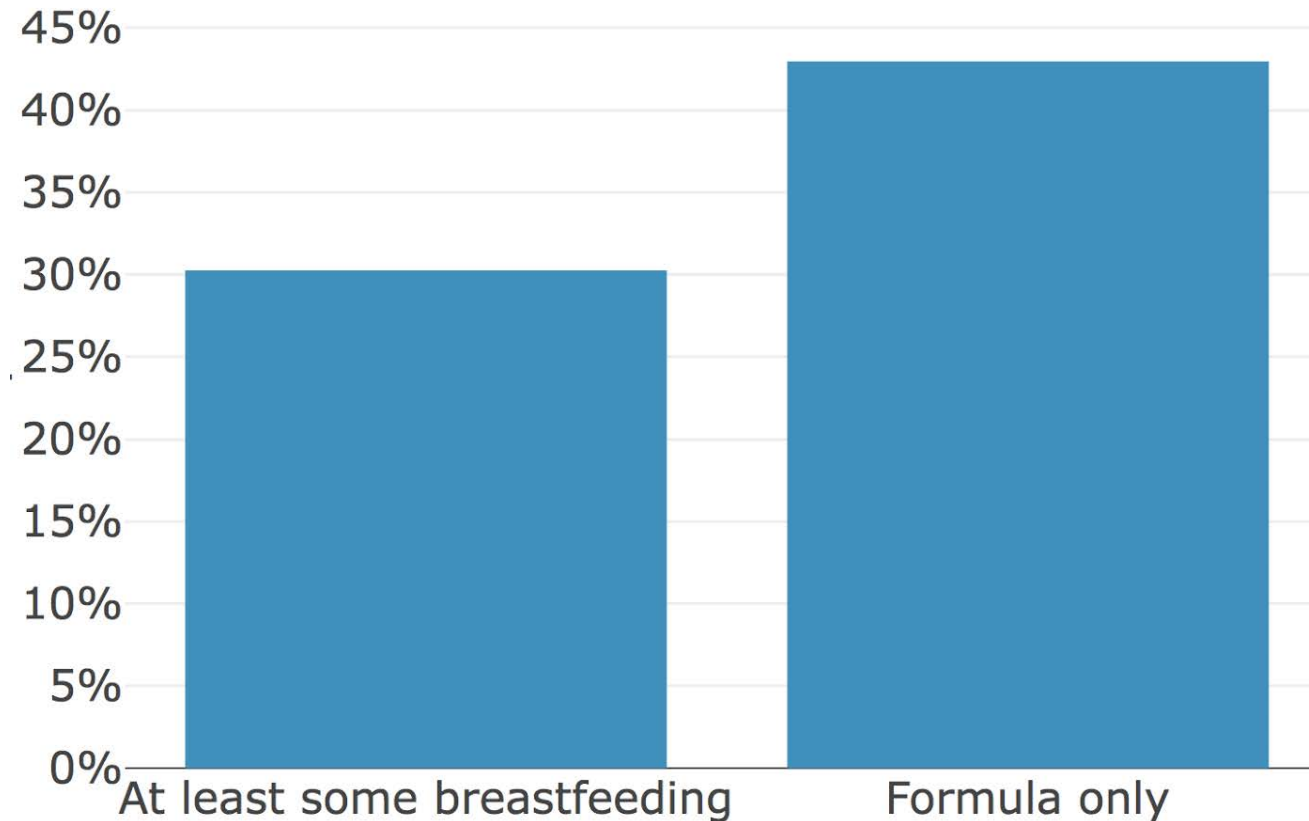

Three factors in the tree model were especially insightful to the WIC team: feeding choice, prenatal engagement, and English speaking

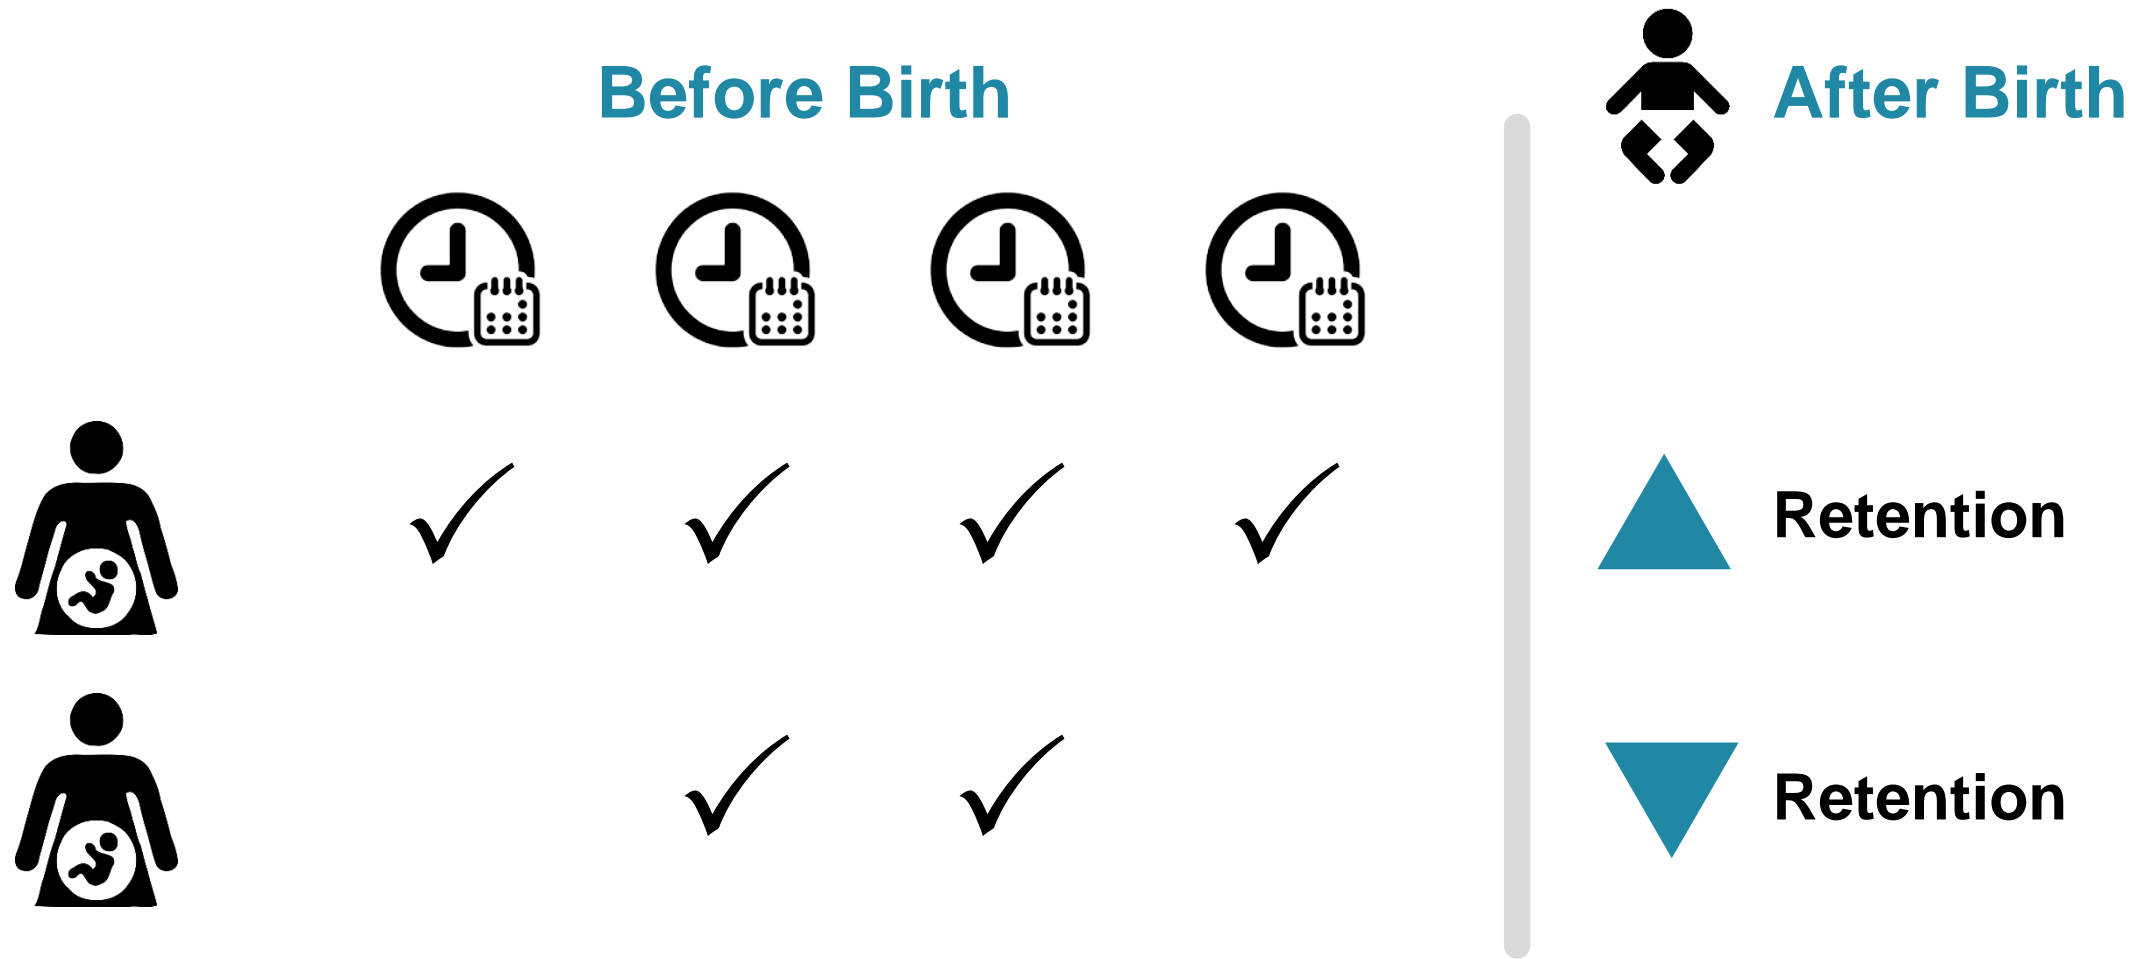

Key Finding: Babies who were exclusively formula fed are 50% more likely to drop out

Percent of participants who drop out of program by feeding choice

Key Finding: High levels of prenatal engagement are associated with higher retention

Key Finding: English speakers are more likely to drop out regardless of their race/ethnicity

Percent of participants who drop out of program by language preference

**Service
Change**

Qualitative Findings

Hassles, stigma, and expectations gaps are the primary drivers of the drop in retention, particularly among English speakers. Addressing these key factors can improve retention.

Anti-Stigma Campaign

New Technology

Future Outreach Strategy

We are using the insights to:

1. Develop an anti-stigma campaign through clinic refresh
2. Integrate new technology to improve clinic flow and experience
3. Develop future physician and community outreach
